## “Lighten the Load™” of your DALI® Emergency lighting system test & maintenance costs!

Some lighting industry players estimate that manual testing of emergency lighting installations can be a time consuming and expensive process.

Engineers have been required to manually place luminaires on test and record the test results in a logbook for inspection by the authorities. The cost associated with such a process will vary depending on the type of site and the number of luminaires to be tested, but **industry estimates suggest this cost to be £50 per year per.**

If you want to avoid these costs whilst reducing CO2 emissions then you should consider looking at **CNS’s elite DALI® Solution**. This is the latest generation of the world’s first entirely web based solution for the commissioning, control, maintenance and management of open standard DALI® devices including Emergency Lamps or inverters. This solution enables the status of a DALI® Emergency lamp to be viewed via a standard web browser on any suitable web browser platform. Further both Function and Duration tests can be started and monitored remotely.

This saves time and money for both the Maintenance Company and the Client in addition to Carbon miles.
